

ProEdge

Annual Food Plot Mix

MAXIMUM ATTRACTION • MAXIMUM GROWTH

High Quality Forage | Diverse Mix of Annual Species

20 lb (9.09 kg)

COVERS UP TO 20,000 ft² (1,858 m²)

PACKAGED
IN CANADA

ProEdge

Annual Food Plot Mix

WHAT'S IN THE MIX

- Oats
- Italian Ryegrass
- Black Forage Peas
- Crimson Clover
- Forage Soybeans
- Forage Sorghum
- Japanese Millet
- Sunflower
- Purple Top Turnip
- Forage Rapeseed

ProEdge is a diverse blend of annual species designed to deliver high-quality, highly attractive forage for deer and other game animals throughout the growing season. Most species will winter-kill, while crimson clover may overwinter under suitable conditions.

ESTABLISHMENT GUIDELINES

- **Light Requirements**
Minimum 6 hours of light per day.
- **Seeding Timing**
Seed in the Spring when planting conditions are favourable. A late summer seeding (August-Sept) is an option if adequate moisture is available.
- **Site Preparation**
Clear debris and residue from the desired area prior to seeding. For best results light tillage (disc or cultivator) is recommended to open the soil.
- **Seeding**
Broadcast evenly by hand or spreader, then pack or roll to ensure good seed-to-soil contact. Adequate moisture is essential for germination. Recommended seeding rate is 1 lb per 1,000 ft².
- **Fertility**
Apply 1–2 lb per 1,000 ft² of a balanced fertilizer (e.g., 19-19-19) before or shortly after seeding.
- **Maintenance**
Aside from fertilization, no additional maintenance is required for this annual blend.

TIPS FOR BEST RESULTS

- Conduct a soil test prior to planting to assess pH and fertility.
- Ideal pH range: 6.0–7.0. Apply lime if below 6.
- A second fertilizer application (1–2 lb per 1,000 ft²) may be applied 4–6 weeks after seeding, if needed.
- If seeding during the heat of the summer, avoid doing so in dry conditions, as this will reduce and/or delay germination. Try and plant ahead of a rain event.

NUTRITIONAL VALUE

ProEdge's mix of Grasses, Legumes and Brassicas provides high energy and protein feed for wild game animals. Good soil fertility or the addition of fertilizer will lead to higher biomass production and higher nutritional value.
